There are known power semiconductor modules of the type, in which a gate drive circuit (hereinafter referred to as a "gate drive IC") is disposed in a gate-side portion of a semiconductor switching element, and a gate drive terminal of the gate drive IC is connected to a gate terminal of the semiconductor switching element through a connector, for example, as disclosed in Japanese Patent Application Laid-open No. H9-319415.[Synthesis and antimycotic activity of polyether cephalosporins]. The aim of this work was to develop new cephalosporin compounds that would have a broad spectrum of activity and low toxicity. In the first part of the research work, the general structure of the final product was established, while in the second, the synthesis of the compound was investigated. The compounds were synthesized in two ways. In the first part of the synthesis the N-1 side chain was elaborated, while in the second, the two functions (7-aminocephalosporanic acid and 7-aminocephalosporin) were condensed. The synthesis methodologies included the use of Wittig reaction, the microwave-assisted reaction and the conventional acylation. The reactions were monitored by using TLC and HPLC. The antimycotic activity was evaluated by the agar dilution method, and the toxicological evaluation was performed in the Ames test. The activity of the final compounds was established by comparison of the inhibitory concentrations obtained with the standard antibiotic cefotaxime and cefuroxime. The new compounds synthesized exhibited antibacterial activity comparable to that of the standard antibiotic cefotaxime. The compounds were considerably less toxic than the standard antibiotic cefotaxime.Optical versus electronic zoom of images with a camera phone. Many cell-phone cameras have an electronic zoom (up to 10x) that uses interpolation of the 82157476af
