We provide the best in class license plate detection and recognition solutions for agencies, businesses and citizens to check out. Free downloads for all applications listed in this post. General Information License plates are the visual identifier of a vehicle and in most countries they are legally required to display a standard number plate that uniquely identifies the vehicle. For example, in the UK, EU and US, the basic standard for number plates is: Based on the ISO 3166 standard. The last five (or six) characters or symbols are typically referred to as an alpha-numeric license plate. The first character is often called a prefix or an alphanumeric starting position. The full, unredacted number plate string is unique to a given vehicle, often starting with a unique 5 or 6 character prefix followed by a unique 3 or 4 character suffix. These unique numbers are usually displayed to the public at registration or on plate frames. Most governments use standards of nine (or 10) characters. These are as follows: In addition, there are a few countries (such as the UK) that have a second set of alpha-numeric numbers on the license plate in one or more

places. These other numbers are called local registration plates and are usually displayed on the vehicle and contain additional information about the vehicle owner, typically vehicle registration (even when this information is already available at the main license plate). To add this information, the standard license plate of a vehicle is often augmented with additional characters, which can be ordered in the following way: This is the standard layout for vehicle license plates worldwide. For the UK and other countries that use the 10 character standard, the characters will be placed as follows: N.B. Some other countries and continents use variants of this layout, for example, the US layout places the local registration in a special position after the main license plate and the characters will be placed in the following way: N.B. The following countries and continents use variants of the standard 10 character layout: Facial Recognition The Autoprime ZR200 is an industrial level facial recognition system and the ideal platform for face detection, registration, and recognition. With real-time recognition capability on both live and previously recorded faces, this facial biometric tool can help increase security, verify identity, speed up biometric enrolment, and improve customer service. With over 600 applications, the Autop 82157476af
